

Support Macros & Help Center - Common Questions

Troubleshooting low opt-in rate, attribution, and Shopify integration.

ARTICLE OWNER	RelayFox Customer Success	REVISED	May 14, 2026
AUDIENCE	Brand admins and support agents	APPLIES TO	RelayFox Web + Shopify connector
SLA TIER	Standard: 1 business day	ARTICLE IDS	HC-201, HC-214, HC-233

Corpus notice: This is a synthetic demonstration document created for Cortex Search evaluation. Brand names, people, metrics, URLs, short codes, and incidents are fictional.

HC-201 - Why is my opt-in rate low?

For Juniper & Coast, a healthy embedded-form SMS opt-in rate is usually 3%-6% of eligible sessions. Checkout opt-in is typically 8%-14% of eligible checkouts. Compare like-for-like traffic sources and devices before treating a change as a platform defect.

Diagnostic sequence

- Confirm eligibility denominator. Exclude existing subscribers, bots, unsupported countries, pages where the form is intentionally hidden, and sessions that never loaded the form script.
- Check render and timing. Use the RelayFox form preview on iOS Safari, Android Chrome, and desktop. A display delay above 20 seconds reduced Juniper & Coast mobile opt-in by 22% in an April 2026 test.
- Validate consent submit events. In Events Explorer, filter event_name = consent_submitted and compare with form_view. A gap above 5% may indicate blocked scripts or a theme conflict.
- Review the value proposition. Generic "join our list" copy underperformed "10% off your first trail layer" by 31% for Juniper & Coast.
- Check source mix. Paid social visitors opted in at 2.7% during Q2 2026; direct and organic visitors opted in at 5.8%.

Agent macro - low opt-in rate

Thanks for flagging the opt-in change. I checked the last 14 days against the prior 14 days. Your eligible-session opt-in rate is {{current_rate}} versus {{prior_rate}}. The biggest change is {{finding}}. Please test {{recommended_test}} for seven days; RelayFox will keep the consent disclosure and source records unchanged. If submit events remain more than 5% below form submissions, reply with a screen recording and theme version so we can investigate the integration.

HC-214 - How does RelayFox attribute revenue?

RelayFox uses click-based attribution by default. Broadcasts use a 24-hour click window and a 5-day order window after the eligible click. Automated flows use a 7-day click window and a 7-day order window after the eligible click. There is no view-through credit in standard reports.

- An order must resolve to the same customer through phone, authenticated checkout, or approved identity bridge.
- If multiple eligible SMS/MMS clicks exist, the most recent click receives credit. Email and paid-media attribution may differ because those systems use separate models.
- Refunds and cancellations are removed from net attributed revenue during daily reconciliation. Reports can change for up to 14 days after the order.
- The Q3 Trailhead Flash Sale shows \$286,740 after reconciliation; the first-day dashboard showed \$294,180 before refunds and duplicate-order cleanup.

Agent macro - attribution question

RelayFox credited {{order_number}} to {{campaign_or_flow}} because the customer clicked message {{message_step}} at {{click_time}} and ordered at {{order_time}}, inside the configured {{window}} window. The report uses the most recent eligible SMS/MMS click and excludes view-through orders. The order currently contributes {{net_revenue}} after discounts, refunds, tax, and shipping rules.

HC-233 - Shopify integration troubleshooting

Expected behavior

The RelayFox Shopify connector ingests customers, consent state, products, carts/checkouts, orders, fulfillments, refunds, and selected metafields. Webhooks normally appear in RelayFox within 2 minutes; nightly reconciliation runs at 2:30 AM store local time. Initial historical backfill covers 90 days of orders unless Customer Success approves a larger window.

Symptom	Likely cause	Resolution
New orders missing for > 10 minutes	Webhook disabled, app token revoked, or Shopify incident	In Settings > Integrations, run Connection Test. Reauthorize if scope check fails. Do not reinstall before exporting current field mappings.
Consent differs between Shopify and RelayFox	Older theme posts a marketing flag without RelayFox disclosure version	Update the theme extension and map Shopify SMS marketing consent only when consent_level = confirmed.
Product links open wrong market	Storefront domain or market handle not mapped	Set canonical domain and locale rules; re-sync catalog. Existing sent links cannot be changed.
Duplicate customers	Different phone formats or guest checkout without normalized E.164 phone	Run Identity Preview; merge only when phone and order evidence agree.
Cart flow does not trigger	Checkout event has no valid SMS consent or cart value below flow minimum	Inspect event eligibility reason. Do not override consent gating.

Connection test checklist

- 1 Shop domain resolves and app installation is active.
- 2 Required scopes are present for customers, products, orders, and marketing events.
- 3 Webhook subscriptions show HTTP 2xx success over the last 60 minutes.
- 4 A test product, test customer, and zero-dollar test order appear in Events Explorer.
- 5 Store timezone, currency, and canonical domain match the Shopify admin.

Agent macro - Shopify connector

I ran the RelayFox connection test for `{{shop_domain}}` at `{{test_time}}`. Authentication is `{{auth_status}}`, webhooks are `{{webhook_status}}`, and the latest order event received was `{{latest_order_time}}`. The next step is `{{next_step}}`. Please do not uninstall the app, because uninstalling removes webhook history that helps us diagnose the issue.

Escalation package

Include shop domain, RelayFox account ID, campaign/flow ID, example phone or order number, UTC timestamps, screenshots, browser/theme version, and permission to inspect event payloads. Redact payment details. Never paste full consent exports or customer lists into a support ticket.
